

PRESS RELEASE

AUDIOSCIENCE'S ASI2202 – A LITTLE BIT OF COBRANET® *Six Flags Spurs on Development of the 2x3 Box*

For Immediate Release

NEWCASTLE, DE (February 16, 2010) – AudioScience, Inc., a leader of professional audio peripherals for the broadcast and installed sound and entertainment industries, expands their popular CobraNet line of products with the addition of the ASI2202; a two channel in, two channel out, CobraNet device. Compact in size to be used anywhere, the ASI2202 can take two channels of line in or mic in audio, convert the streams to CobraNet networked audio, and send them to any CobraNet-compliant device. The ASI2202 also is equipped with 2 channels of line level analog output.

Spurred on by requests from Brian Sherlin, the corporate audio manager for Six Flags, AudioScience once again listened to its customers to create a product needed in the marketplace. "We've seen an increased use of our CobraNet products in amusement parks large and small," said Richard Gross, president of AudioScience. "Our ASI2202 wasn't even released but when Brian heard about it he was anxious to try it in the park."

Talking to Richard Gross, Brian stated, "I am excited to have a unit that is scaled to do exactly what we need, at the right price point. It has the correct number of inputs and outputs in locations where we don't need a larger box that costs thousands more. Even though I know you and your people did the hard work, I take personal pride in this product since your company worked to produce it per my request. What a great company to work with!"

The ASI2202 has phantom power available on the inputs and user-selectable input levels. AudioScience's set-up and mixer application, designated ASIControl, can be used to configure the routing connections to/from the ASI2202 and any other CobraNet-compliant device. SDKs are available for Windows and Linux.

For pricing and further information, contact Richard Gross or Nicole Gross at +1-302-324-5333 or T.K. Pang in Asia at +65 98184303.
